

Dear recruiter,

I am excited to apply for the UX Research position within your team. With over 5 years of experience in front-end development, UX Research and methodology, Product Engineering, and strong expertise in Figma, I am confident in my ability to contribute to the development of digital products and their optimization.

My Master's degree in Industrial Design from the University of Twente, with a focus on human-technology relations, has equipped me with a deep understanding of user needs and iterative design processes, enabling me to create innovative and functional solutions.

As a Product Engineer at WearM.ai, I designed a biomechanical analysis platform, translating complex data into intuitive visual experiences.

At PocketUp, as a founder, I designed and developed the system and project product: from user experience design to the technical implementation of a mobile platform and a web back-office (React Native, Nextjs, Node.js, TS). This initiative allowed me to translate a strategic vision into a concrete product, centered around the needs of students.

At Knaek, I redesigned a student discount mobile application for a fresher look and to boost their user engagement. I studied, ideated, and conceptualized interfaces through end-user feedback and UX Research applied to their specific business case. An interactive prototype for the final concept was delivered after successful evaluation stages. The design has since been integrated in their latest product update and is now live.

A strong connection between design and code development has enabled me to create functional, high-performance, and user-adapted solutions, while facilitating communication between designers and developers.
